## Applied forecasting

Week 6: Exponential smoothing

# Historical perspective

- Developed in the 1950s and 1960s as methods (algorithms) to produce point forecasts.
- Combine a “level”, “trend” (slope) and “seasonal” component to describe a time series.
- The rate of change of the components are controlled by “smoothing parameters”:  $\alpha$ ,  $\beta$  and  $\gamma$  respectively.
- Need to choose best values for the smoothing parameters (and initial states).
- Equivalent ETS state space models developed in the 1990s and 2000s.

**Exponential Smoothing**

**Error Trend Seasonal**

**Exponential Smoothing**

**Error Trend Seasonal**

- ETS(A,N,N): **A**dditive Error, **N**o Trend, **N**o Seasonality

## Exponential Smoothing

### Error Trend Seasonal

- ETS(A,N,N): **A**dditive Error, **N**o Trend, **N**o Seasonality
- ETS(M,A,N): **M**ultiplicative Error, **A**dditive Trend, **N**o Seasonality

## Exponential Smoothing

### Error Trend Seasonal

- ETS(A,N,N): **A**dditive Error, **N**o Trend, **N**o Seasonality
- ETS(M,A,N): **M**ultiplicative Error, **A**dditive Trend, **N**o Seasonality
- ETS(M,A,M): **M**ultiplicative Error, **A**dditive Trend, **M**ultiplicative Seasonality

etc

# Big idea: control the rate of change

$\alpha$  controls the flexibility of the **level**

- If  $\alpha = 0$ , the level never updates (mean)
- If  $\alpha = 1$ , the level updates completely (naive)

$\beta$  controls the flexibility of the **trend**

- If  $\beta = 0$ , the trend is linear
- If  $\beta = 1$ , the trend changes suddenly every observation

$\gamma$  controls the flexibility of the **seasonality**

- If  $\gamma = 0$ , the seasonality is fixed (seasonal means)
- If  $\gamma = 1$ , the seasonality updates completely (seasonal naive)

# Models and methods

## Methods

- Algorithms that return point forecasts.

## Models

- Generate same point forecasts but can also generate forecast distributions.
- A stochastic (or random) data generating process that can generate an entire forecast distribution.
- Allow for “proper” model selection.

## ETS(A,N,N): SES with additive errors

State equation

$$l_t = l_{t-1} + \alpha \varepsilon_t$$

Observation equation

$$y_t = l_{t-1} + \varepsilon_t$$

Forecast equation

$$\hat{y}_{t+h|t} = l_t$$

# ETS(A,N,N): SES with additive errors

State equation

$$\ell_t = \ell_{t-1} + \alpha \varepsilon_t$$

Observation equation

$$y_t = \ell_{t-1} + \varepsilon_t$$

Forecast equation

$$\hat{y}_{t+h|t} = \ell_t$$

- Forecast errors:  $\varepsilon_t = y_t - \ell_{t-1} \sim \text{NID}(0, \sigma^2)$
- “innovations” or “single source of error” because equations have the same error process,  $\varepsilon_t$ .
- equivalent forecasts:

$$\hat{y}_{t+h|t} = (1 - \alpha)^t \ell_0 + \sum_{j=0}^{t-1} \alpha (1 - \alpha)^j y_{t-j}$$

# ETS(A,A,N): Holt's method with additive errors

State equations

$$\ell_t = \ell_{t-1} + b_{t-1} + \alpha \varepsilon_t$$

$$b_t = b_{t-1} + \beta \varepsilon_t$$

Observation equation

$$y_t = \ell_{t-1} + b_{t-1} + \varepsilon_t$$

Forecast equation

$$\hat{y}_{t+h|t} = \ell_t + hb_t$$

- Forecast errors:  $\varepsilon_t = y_t - \ell_{t-1} \sim \text{NID}(0, \sigma^2)$

# ETS(A,A,A): Holt-Winters additive method

State equations

$$\ell_t = \ell_{t-1} + b_{t-1} + \alpha \varepsilon_t$$

$$b_t = b_{t-1} + \beta \varepsilon_t$$

$$s_t = s_{t-m} + \gamma \varepsilon_t$$

Observation equation

$$y_t = \ell_{t-1} + b_{t-1} + s_{t-m} + \varepsilon_t$$

Forecast equation

$$\hat{y}_{t+h|t} = \ell_t + hb_t + s_{t+h-m(k+1)}$$

- Forecast errors:  $\varepsilon_t = y_t - \ell_{t-1} \sim \text{NID}(0, \sigma^2)$
- $k$  is integer part of  $(h - 1)/m$ .

## ETS(M,N,N): SES with multiplicative errors.

State equation	$\ell_t = \ell_{t-1}(1 + \alpha\varepsilon_t)$
Observation equation	$y_t = \ell_{t-1}(1 + \varepsilon_t)$
Forecast equation	$\hat{y}_{t+h t} = \ell_t$

## ETS(M,N,N): SES with multiplicative errors.

State equation	$\ell_t = \ell_{t-1}(1 + \alpha\varepsilon_t)$
Observation equation	$y_t = \ell_{t-1}(1 + \varepsilon_t)$
Forecast equation	$\hat{y}_{t+h t} = \ell_t$

- Relative forecast errors:  $\varepsilon_t = \frac{y_t - \hat{y}_{t|t-1}}{\hat{y}_{t|t-1}} \sim \text{NID}(0, \sigma^2)$
- Same point forecasts as ETS(A,N,N) with additive errors and same  $\alpha$ .
- Different prediction intervals from ETS(A,N,N).

# ETS(M,A,N): Holt's method with multiplicative errors.

State equations

$$\ell_t = (\ell_{t-1} + b_{t-1})(1 + \alpha\varepsilon_t)$$

$$b_t = b_{t-1} + \beta(\ell_{t-1} + b_{t-1})\varepsilon_t$$

Observation equation

$$y_t = (\ell_{t-1} + b_{t-1})(1 + \varepsilon_t)$$

Forecast equation

$$\hat{y}_{t+h|t} = \ell_t + hb_t$$

- Relative forecast errors:  $\varepsilon_t = \frac{y_t - \hat{y}_{t|t-1}}{\hat{y}_{t|t-1}} \sim \text{NID}(0, \sigma^2)$
- Same point forecasts as ETS(A,A,N) with additive errors and same  $\alpha$  and  $\beta$
- Different prediction intervals from ETS(A,A,N).

# ETS(M,A,M): Holt-Winters multiplicative method

State equations

$$\ell_t = (\ell_{t-1} + b_{t-1})(1 + \alpha\varepsilon_t)$$

$$b_t = b_{t-1} + \beta(\ell_{t-1} + b_{t-1})\varepsilon_t$$

$$s_t = s_{t-m}(1 + \gamma\varepsilon_t)$$

Observation equation

$$y_t = (\ell_{t-1} + b_{t-1})s_{t-m}(1 + \varepsilon_t)$$

Forecast equation

$$\hat{y}_{t+h|t} = (\ell_t + hb_t)s_{t+h-m(k+1)}$$

- Relative forecast errors:  $\varepsilon_t = \frac{y_t - \hat{y}_{t|t-1}}{\hat{y}_{t|t-1}} \sim \text{NID}(0, \sigma^2)$
- $k$  is integer part of  $(h - 1)/m$ .
