

# ETC3550/ETC5550 Applied forecasting

Week 6: Simple Exponential smoothing

## **Historical perspective**

- Developed in the 1950s and 1960s as methods (algorithms) to produce point forecasts.
- Combine a "level", "trend" (slope) and "seasonal" component to describe a time series.
- The rate of change of the components are controlled by "smoothing parameters":  $\alpha$ ,  $\beta$  and  $\gamma$  respectively.
- Need to choose best values for the smoothing parameters (and initial states).
- Equivalent ETS state space models developed in the 1990s and 2000s.

## Big idea: control the rate of change

 $\alpha$  controls the flexibility of the **level** 

- If  $\alpha$  = 0, the level never updates (mean)
- If  $\alpha$  = 1, the level updates completely (naive)

 $\beta$  controls the flexibility of the **trend** 

- If  $\beta$  = 0, the trend is linear
- If  $\beta$  = 1, the trend changes suddenly every observation

 $\gamma$  controls the flexibility of the **seasonality** 

- If  $\gamma$  = 0, the seasonality is fixed (seasonal means)
- If  $\gamma$  = 1, the seasonality updates completely (seasonal naive)

### **Models and methods**

#### **Methods**

Algorithms that return point forecasts.

#### **Models**

- Generate same point forecasts but can also generate forecast distributions.
- A stochastic (or random) data generating process that can generate an entire forecast distribution.
- Allow for "proper" model selection.

#### **Iterative form**

$$\hat{y}_{t+1|t} = \alpha y_t + (1 - \alpha)\hat{y}_{t|t-1}$$

#### **Iterative form**

$$\hat{y}_{t+1|t} = \alpha y_t + (1 - \alpha)\hat{y}_{t|t-1}$$

## **Weighted average form**

$$\hat{y}_{T+1|T} = \sum_{j=0}^{T-1} \alpha (1-\alpha)^{j} y_{T-j} + (1-\alpha)^{T} \ell_{0}$$

#### **Iterative form**

$$\hat{\mathbf{y}}_{t+1|t} = \alpha \mathbf{y}_t + (1 - \alpha)\hat{\mathbf{y}}_{t|t-1}$$

## Weighted average form

$$\hat{y}_{T+1|T} = \sum_{j=0}^{T-1} \alpha (1-\alpha)^{j} y_{T-j} + (1-\alpha)^{T} \ell_0$$

#### **Component form**

Forecast equation  $\hat{y}_{t+h|t} = \ell_t$ Smoothing equation  $\ell_t = \alpha y_t + (1 - \alpha)\ell_{t-1}$ 

## **Component form**

Forecast equation

Smoothing equation

$$\hat{y}_{t+h|t} = \ell_t$$

$$\ell_t = \alpha y_t + (1 - \alpha)\ell_{t-1}$$

#### **Component form**

Forecast equation

Smoothing equation

$$\hat{y}_{t+h|t} = \ell_t$$

$$\ell_t = \alpha y_t + (1 - \alpha)\ell_{t-1}$$

Forecast error:  $e_t = y_t - \hat{y}_{t|t-1} = y_t - \ell_{t-1}$ .

#### **Component form**

Forecast equation 
$$\hat{y}_{t+h|t} = \ell_t$$
  
Smoothing equation  $\ell_t = \alpha y_t + (1 - \alpha)\ell_{t-1}$ 

Forecast error:  $e_t = y_t - \hat{y}_{t|t-1} = y_t - \ell_{t-1}$ .

#### **Error correction form**

$$y_t = \ell_{t-1} + e_t$$
  
 $\ell_t = \ell_{t-1} + \alpha (y_t - \ell_{t-1})$   
 $= \ell_{t-1} + \alpha e_t$ 

#### **Component form**

Forecast equation  $\hat{y}_{t+h|t} = \ell_t$ Smoothing equation  $\ell_t = \alpha y_t + (1 - \alpha)\ell_{t-1}$ 

Forecast error:  $e_t = y_t - \hat{y}_{t|t-1} = y_t - \ell_{t-1}$ .

#### **Error correction form**

$$y_t = \ell_{t-1} + e_t$$
  
 $\ell_t = \ell_{t-1} + \alpha (y_t - \ell_{t-1})$   
 $= \ell_{t-1} + \alpha e_t$ 

Specify probability distribution:  $e_t = \varepsilon_t \sim \text{NID}(0, \sigma^2)$ .

# ETS(A,N,N): SES with additive errors

#### ETS(A,N,N) model

Observation equation  $y_t = \ell_{t-1} + \varepsilon_t$ State equation  $\ell_t = \ell_{t-1} + \alpha \varepsilon_t$ 

where  $\varepsilon_t \sim \text{NID}(0, \sigma^2)$ .

- "innovations" or "single source of error" because equations have the same error process,  $\varepsilon_t$ .
- Observation equation: relationship between observations and states.
  - State equation(s): evolution of the state(s) through time.

## ETS(M,N,N): SES with multiplicative errors.

- Specify relative errors  $\varepsilon_t = \frac{y_t \hat{y}_{t|t-1}}{\hat{y}_{t|t-1}} \sim \text{NID}(0, \sigma^2)$
- Substituting  $\hat{y}_{t|t-1} = \ell_{t-1}$  gives:
  - $y_t = \ell_{t-1} + \ell_{t-1} \varepsilon_t$
  - $e_t = y_t \hat{y}_{t|t-1} = \ell_{t-1} \varepsilon_t$

## ETS(M,N,N): SES with multiplicative errors.

- Specify relative errors  $\varepsilon_t = \frac{y_t \hat{y}_{t|t-1}}{\hat{y}_{t|t-1}} \sim \text{NID}(0, \sigma^2)$
- Substituting  $\hat{y}_{t|t-1} = \ell_{t-1}$  gives:
  - $y_t = \ell_{t-1} + \ell_{t-1} \varepsilon_t$
  - $e_t = y_t \hat{y}_{t|t-1} = \ell_{t-1}\varepsilon_t$

## ETS(M,N,N) model

$$y_t = \ell_{t-1}(1 + \varepsilon_t)$$
$$\ell_t = \ell_{t-1}(1 + \alpha \varepsilon_t)$$

8

# ETS(M,N,N): SES with multiplicative errors.

- Specify relative errors  $\varepsilon_t = \frac{y_t \hat{y}_{t|t-1}}{\hat{y}_{t|t-1}} \sim \text{NID}(0, \sigma^2)$
- Substituting  $\hat{y}_{t|t-1} = \ell_{t-1}$  gives:
  - $V_t = \ell_{t-1} + \ell_{t-1} \varepsilon_t$
  - $e_t = y_t \hat{y}_{t|t-1} = \ell_{t-1}\varepsilon_t$

#### ETS(M,N,N) model

Observation equation 
$$y_t = \ell_{t-1}(1 + \varepsilon_t)$$
  
State equation  $\ell_t = \ell_{t-1}(1 + \alpha \varepsilon_t)$ 

Models with additive and multiplicative errors with the same parameters generate the same point forecasts but different prediction intervals.
